JUNDSB
alpha-amylase (EC 3.2.1.1) precursor - Aspergillus oryzae
Nighternate names: Taka-amylase A
Nighternate names: Taka-amylase A
C;Species: Appergillus oryzae
C;Date: 11-Dec-1993 #sequence_revision 31-Dec-1993 #text_change 09-Jul-2004
C;Accession: JN0588
C;Accession: JN0588
A;Title: Isolation of a cDNA encoding Aspergillus oryzae Taka-amylase A: evidence for mu A;Recession: JN0588
A;Reterence number: JN0588; MUID:90128276; PMID:2612911
A;Accession: JN0588
A;Molecule type: mRNA
A;Residus: 1-499 4-720.
A;Residus: 1-490 4-720.
A;Residus: 1-404/3
C;Reywords: 91ycoprotein; 91ycosidase; hydrolase; polyasccharide degradation
C;Superfamily: Aspergillus alpha-amylase; hydrolase; polyasccharide degradation
C;Superfamily: Aspergillus alpha-amylase; hydrolase; polyasccharide degradation
C;Reywords: 91ycoduct: alpha-amylase core homology
C;Reywords: 91ycoduct: alpha-amylase core homology AMX>
F;218/Binding site: carbohydrate (Asn) (covalent) #status predicted
A;21/Ponain: alpha-amylase core homology AMX>
E;218/Binding site: carbohydrate (Asn) (covalent)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          alpha-amylase (EC 3.2.1.1) SWA2 precursor - yeast (Schwanniomyces occidentalis)
N.Alternate names: alpha-1, 4 glucanohydrolase
C.Species: Schwanniomyces occidentalis
C.Species: 31-Dec-1993 #sequence_revision 31-Dec-1993 #text_change 09-Jul-2004
C.Accession: S33921

"Cloning of the aupha-amylase CDNA of Aspergillus shirousamii and its expression in Saccharomyces cerevisiae ";

Biosci. Biochem. Sci174-179(1992).

-I. CATALYTIC ACTIVITY: Endohydrolysis of 1.4-alpha-glucosidic

Inkages in oligosaccharides and polysaccharides.

-I. COPCTOR: Binda 2 calcium inons per subunit. Calcium is inhibitory at high concentrations (By similarity).

-I. SIMILARITY: Belongs to the glycosyl hydrolase 13 family.

"Cloning, characterization, and expression of two alpha-amylase genes
from Aspergillus niger var. awamori.";
Curr. Genet. 17:203-212(1990).
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
                                                                                                                                                                                                                                                                                                                                    linkages in oligosaccharides and polysaccharides.
-!- COFACTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory at high concentrations (By similarity).
-!- SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Interpro; IPR006589; Alp amyl_cat_sub.

T "Amyl, the alpha-amylase gene of Aspergillus flavus: Involvement in aflatoxin biosynthesis in maize kernels.";

L bhytopathology 89:908-914(1999).

C -!- SIMILARITY: Belongs to family 13 of glycosyl hydrolases.

E MBL; AF139925; AAF14264.1; --.

-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
-!- COFACTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory
at high concentrations (By similarity).
-!- SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HSSP; P10529; 7TAA.

```
Variant alpha amylase enzymes which have improved washing and/or as detergent additives. The enzymes have one or more amino acid residues added, deleted or substituted. The variants can also be used for textile desizing prior to scouring, bleaching and dyeing. The variants have improved thermostability, acid/alkaline stability, low temperature optimum; pH optimum; higher hydrolysis velocity and improved tolerance to other composition constituents, e.g. oxidation agents. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                           Oxidation stable alpha amylases can be used for the simultaneous desizing and bleaching or scouring of a fabric comprising starch or starch derivatives. They exhibit a better heat stability, especially in the presence of oxidising agents. They are obtained from a parent alpha amylase by replacing one or more methionine residues with any amino acid different from Cys or Met, preferably Leu, Thr, Ala, Gly, Ser, Ile or Asp. The parent alpha amylase is pref. derived from a Bacillus species, although alpha amylases of fungal oxigin can also be used. This sequence is the wild type (unmodified) alpha amylase of Aspergillus oryzae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          140

/note= "preferred region where at least one amino acid
residue of a parent alpha amylase (used as a template for
a variant) corresponding to 196-198 of AAW14499 is
deleted or replaced with a fragment corresponding to this
                                                                                                                                                                                                                                                                                                     /note= "at least one amino acid residue of a parent alpha -amylase (used as a template for a variant) corresponding to 322-346 of AAW14498 is deleted or replaced with a fragment corresponding to this fragment; claim 36"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the mature Aspergillus oryzae alpha-amylase (A). Variants of parent termamyl- and fungamyl-like alpha-amylases (and methods of constructing them) are claimed. Examples of variants are featured above. The variants have altered properties such as calcium dependency, substrate binding and stability. Also one or more proline or cysteine residues in the variant is modified or replaced with a non-proline or non-cystein residue such as alanine. The variants can be used for (dish)washing, as detergent additives or for fabric desizing or starch liquefaction. They can also be used for the production of sweeteners and ethanol from starch. ```
The present invention relates to a method of producing heterologous biological substance. The method involves culturing mutant of wild-type biological substance. The medium suitable for producing heterologous biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide heterologous biological substance and second nucleotide sequences comprising modification of glucomytase (glash) and recovering heterologous biological substance. The present sequence is the Aspergillus niger neutral alpha-amylase A (amyA) protein.
                                                                                                                                                                                                                                                                300

biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide sequences comprising modification of glucosmylase (glaA) and recovering heterologous biological substance. The present sequence is the Aspergillus niger neutral alpha-amylase B (amyB) protein.

The method involves culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous

Mature taka-amylase A.

```
The present invention describes polynucleotides which encode processing enzymes (e.g. alpha-amylase, pullulanase, alpha-glucosidase, glucose isomerase, or glucoamylase) that are optimised for expression in plants. The polynucleotides encode mesophilic, thermophilic or hyperthermophilic processing enzymes, which are activated under suitable conditions to act upon the desired substrate. Also described are self-processing transgenic plants and plant parts, e.g. grain, which express one or more of these enzymes and have an altered composition that facilitates plant and grain or starch-derived products in a transformed plant part (TPP), by activating the starch processing enzyme contained in it. Transgenic grain is useful or produce food products naving improved taste and to produce fermentable substrates for ethanol and fermented beverages. (M) eliminates the need to mill or physically disrupt the integrity of plant parts prior to recovery of starch-derived products. The present sequence represents alpha-amylase/glucoamylase fusion procein, which is given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                Novel polynucleotide encoding hyperthermophilic processing enzymes e.g. alpha-amylase, useful for producing plant to produce food products having improved taste or fermentable substrates for ethanol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       200

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     206 DIVKHVQKDFWPGYNKAAGVYCIGEVLDGDFAYTCPYQNVMDGVLNYPIYYPLLNAFKST 265
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the mature form of taka-amylase from A. oryzae. This sequence was used in a method for the generation of mutant pullulanases for use in the food industry (see also AAR79026-28). The wild type pullulanase enzyme was modified by the method of the invention for enhancing the hydrophobicity of a selected site of the pullulanase. The method comprises replacement of a group in the selected site with a hydrophobic group, replacement of an amino acid with a hydrophobic and/or insertion or deletion of a hydrophobic amino acid from the selected site. The method was used to produce neopullulanases Y377F,
                           stearothermophilus; mutant; food industry; replacement insertion; deletion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SGSMDDLYNMINTVKSDCPDSTLLGTFVENHDNPRFASYTNDIALAKNVAAFIILNDG 343

complete. Manufacturing maltogenic amylase comprises the following steps:

(1) obtaining a gene of maltogenic amylase from Thermus sp. IM6501 (KCTC 5027BP) and inserting the gene into plasmid putl19 to construct recombinant DNA (pThMA119); (ii) inserting the recombinant DNA to the for 10 hours in Luria-Bertani (LB) media and centrifuging the media to obtain a microbial cell; (iii) suspending the microbial cell with buffer solution at pH 7.5 and obtaining supernatant; and (iv) passing the supernatant through column chromatography and obtaining purified maltogenic amylase. The maltogenic amylase is a dimer comprised of two maltogenic amylase molecules, and a Thermus sp. IM6501 maltogenic amylase consists of anino acid residues of credion that consists of amino acid residues of spro44, Tyr45, Arg81, Arg83, Pro118, Cys116, Asn131, Glu1322, Val1329, and Hisla60. The present sepresents happergillus oryzae TARA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            248 IGEVLDGDPAYTCPYQNVMDGVLNYPIYYPLLNAFKSTSGSMDDLYNMINTVKSDCPDST 307
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes manufacturing maltogenic amylase (EC 3.2.1.133) having improved transglycosylation activity, comprising using crystallisation and the three dimensional structure of maltogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence encoded by the preregion and the 5' part of the structural gene for the TAKA-amylase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mutant alpha-amylase from Bacillus species comprising a methionine substitution - with improved stability and activity at low pH, for use in detergents, dishwashing agents and liquefaction agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence os that of the Asoergillus oryzae alpha amylase, sold commercially as FUNGAMYL (TM) by Novo Nordisk A/S. The sequence can be mutated by substitution of one or more of its methionine residues for any amino acid other than cysteine. The mutant alpha-amylase exhibits a better activity level and better stability in the presence of oxidiaing agents than previous mutant alpha amylases, and improved thermostability at moderately low pH. The enzyme can be used as an additive for detergents, dishwashing agents and liquifaction agents. (Updated on 25-MAR-2001 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               305

```
The DNA was prepared from mycelium from A. niger DSM 2761. It was screened with a hybridsation probe from TAKA-amylase cDNA and two hybridising clones were found. Plasmids pNA1 and pNA2 each carry the full length amylase gene with promoters and upstream activating sequences. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                           Prodn. of proteins in Aspergillus – using promoter and upstream activating sequences derived from Aspergillus niger amylase genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yeast promoter; expression vector; TAKA-amylase; alpha-amylase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The patent claims a process for the production of protein products in Aspergillus oryzaca and a promoter for use in Aspergillus. The process enables industrial production of many different polypeptides and proteins in A. oryzae. Examples of such products are chymosin or prochymosin and other rennets, proteases, lipases and amylases. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Aspergillus niger neutral alpha-amylase including preregion as encoded by plasmids pNal and pNA2.

The DNA whose sequence is in AAQ24569 was derived from the TAKA- amylase clone. It was inserted in BamHI digested pBR322 to give plasmid pTAKA 17. In pTAKA 17 the A. oryzae derived DNA is shown as a 5.5 kb BamHi/Sau 3AI - BamHI/Sau 3AI fragment, the promoter and upstream activating sequences representing a 2.1 kb fragment. In the method according to the present invention the sequence from nucleotide -1144 to nucleotide -10 has been used as one example of a well functioning part of the promoter region. In another embodiment of the present invention the nucleotide sequence from nucleotide - 1176 to -1 was preceded by the still not sequenced 1.05 kb fragment from pTAKA 17. Producing a polypeptide of interest in a filamentous fungus comprises providing a modified DNA sequence by inserting a DNA sequence encoding one or more amino acid residues in between 2 DNA sequences.

Disclosure; SEQ ID NO 3; 36pp; English.

The invention relates to a method of producing a polypeptide of interest in a filamentous fungus comprising providing a modified DNA sequence by inserting a DNA sequence encoding one or more amino acid residues in between a DNA sequence encoding a polypeptide of interest and the adjacent upstream DNA sequence encoding the N-terminal signal peptide. The methods, DNA sequence, DNA construct and expression vector are useful for producing a polypeptide of interest. This sequence corresponds to the signal peptide sequence from the Aspergillus oryzae fungamyl protein used for producing the polypeptide of interest by the method of the invention.  $\mathbf{x}$   $\mathbf{x}$

Manufacturing maltogenic amylase having improved transglycosylation activity, comprises using crystallization.

Disclosure; Page 188; 196pp; Korean.

The present invention describes manufacturing maltogenic amylase (EC 3.2.1.133) having improved transglycosylation activity, comprising using crystallisation and the three dimensional structure of maltogenic amylase. Manufacturing maltogenic amylase comprises the following steps: (i) obtaining a gene of maltogenic amylase from Thermus sp. 1M6501 (KCTC 5027BP) and inserting the gene into plasmid pUCI19 to construct recombinant DNA (pThMA119); (ii) inserting the recombinant DNA to Escherichia coli MC1061, which is cultivated at 37 plus degrees Celsius for 10 hours in Luria-Bertani (LB) media and centrifuging the media to sobtain a microbial cell; (iii) suspending the microbial cell, with buffer solution at pH 7.5 and obtaining supernatant; and (iv) passing the substrate through column chromatography and obtaining purified maltogenic amylase. The maltogenic amylase is a dimer comprised of two

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mutant alpha-amylase from Bacillus species comprising a methionine substitution - with improved stability and activity at low pH, for use in detergents, dishwashing agents and liquefaction agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      commercially as FUNGANYI (TW) by Novo Nordisk A/S. The sequence can be mutated by substitution of one or more of its methionine residues for any amin acid other than cysteine. The mutant alpha-amylase exhibits a better activity level and better stability in the presence of oxidising agents than previous mutant alpha amylases, and improved thermostability at moderately low pH. The enzyme can be used as an additive for detergents, dishwashing agents and liquifaction agents. (Updated on 25-MAR-2003 to correct PM Field.)
         (ThWA) crystal. The amylase has a structure containing an activated region that consists of amino acid residues of Asp-328, Glu-357, Asp-424, and a pocket with glucose bound that consists of amino acid residues of Pro44, Tyr45, Arg81, Arg83, Pro118, Cy8116, Ash1331, Glu1332, Val1329, and His1360. The present sequence represents Aspergillus oryzae TAKA protein (TAA), given in comparison with ThWA in the present invention
 maltogenic amylase molecules, and a Thermus sp. IM6501 maltogenic amylase

The enzymes have one or more amino acid residues added, deleted or substituted. The variants can also be used for textile desizing prior to scouring, bleaching and dyeing. The variants have improved thermostability, acid/alkaline stability; low temperature optimum; highermum; higher hydrolysis velocity and improved tolerance to other composition constituents, e.g. oxidation agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents the mature form of taka-amylase from A. oryzae. This sequence was used in a method for the generation of mutant pullulanases for use in the food industry (see also AAR79026-28). The wild type pullulanase enzyme was modified by the method of the invention for enhancing the hydrophobicity of a selected site of the pullulanase. The method comprises replacement of a group in the selected site with a hydrophobic group, replacement of an amino acid with a hydrophobic amino acid, and/or insertion or deletion of a hydrophobic amino acid, and or insertion or deletion of a hydrophobic amino acid site. The method was used to produce neopullulanases Y377F, the
                                                                                                                                                                                                                                                                                       Modifying a transferase by enhancing hydrophobicity of a selected site increases transfer activity, also new mutant neo-pullulanase(\mathbf{s}).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                alpha-amylase, mature, Bacillus licheniformis, termamyl; fungamyl; Aspergillus oryzae, Bacillus amyloliquefaciens; altered property; calcium dependency; substrate binding; stability; pH optimum; thermostability; cleavage; oligosaccharide substrate; dishwashing; washing; detergent additive; fabric desizing; starch liquefaction; sweetener; ethanol production; variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2; Length 478;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oxidation stable alpha amylases can be used for the simultaneous desizing and bleaching or scouring of a fabric comprising starch or starch derivatives. They exhibit a better heat stability, especially in the presence of oxidising agents. They are obtained from a parent alpha amylase by replacing one or more methionine residues with any amino acid different from Cys or Met, preferably Leu, Thr, Ala, Gly, Ser, Ile or Asp. The parent alpha amylase is pref. derived from a Bacillus species, although alpha amylases of fungal origin can also be used: This sequence is the wild type (unmodified) alpha amylase of Aspergillus oryzae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of an oxidation stable alpha-amylase - for simultaneous desizing and bleaching or scouring of fabrics contg. starch or starch derivs.

a variant) corresponding to 325-345 of AAW14498 is deleted or replaced with a fragment corresponding to this fragment; claim 38"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the mature Aspergillus oryzae alpha-amylase (A). Variants of parent termamyl- and fungamyl-like alpha-amylases (and methods of constructing them) are claimed. Examples of variants are featured above. The variants have altered properties such as calcium dependency, substrate binding and stability. Also one or more proline or cystein residues in the variant is modified or replaced with a non-proline or non-cystein residue such as alanine. The variants can be used for (dish) washing, as detergent additives or for fabric desizing or starch liquefaction. They can also be used for the production of sweeteners and ethanol from starch.                                                                                                                                                                                                     셤
                                                                                                             The present sequence represents a fungamyl-like alpha-amylase. The specification describes variants of this fungamyl-like alpha-amylase, which have an alteration in one the amino acid regions 98-110, 150-160, 160-160, 161-167, 280-288, 448-455, and 468-475. Each alteration is a deletion or substitution of an amino acid or an insertion of an amino acid downstream of a particular position. The variants retain alpha-amylase activity, and have better heat stability and/or stability at acidic ph, relative to wild-type enzyme. The variants can therefore be used at higher comperatures (more efficient conversion or faster reaction, and have reduced need for cooling and reduced risk of contamination). The variants may also be used in conjunction with other enzymes, particularly of high maltose content, or alcohol, from starch; as dough improver for baked goods; in brewing, to increase fermentability of the wort; and for liquefaction of starch
                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing heterologous biological substance comprises culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance and recovering heterologous biological
                                             New variant of Fungamyl-like alpha-amylase, useful for production of maltose syrups, includes mutations that improve stability against heat

The present invention relates to a method of producing heterologous hological substance. The method involves culturing mutant of wild-type haspergillus niger strain in medium suitable for producing heterologous biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide heterologous biological substance and second nucleotide heterologous biological substance. The present sequence is the Aspergillus niger neutral alpha-amylase A (amyA) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Producing heterologous biological substance comprises culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance and recovering heterologous biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method of producing heterologous biological substance. The method involves culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide sequence comparising medification of glucosmylase (glash) and recovering heterologous biological substance. The present sequence is the Aspergillus niger neutral alpha-amylase B (amyB) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes polynucleotides which encode processing enzymes (e.g. alpha-amylase, pullulanase, alpha-glucosidase, glucose carginesase, or glucoamylase) that are optimised for expression in plants. Compose the polynucleotides encode mesophilic, thermophilic or hyperthermophilic. The polynucleotides encode mesophilic, thermophilic or hyperthermophilic or processing enzymes, which are activated under suitable conditions to act upon the desired substrate. Also described are self-processing transgenic composition that facilitates plant and grain comparing. Also described is a method (M) for converting starch to starch-derived products in a transformed plant part (TPP), by activating the starch-derived products of a transformed plant (TP) can be used to composite maltodextrin. A transformed plant (TPP) can be used to produce for ethanol and fermented beverages. (M) eliminates the need to recovery of starch-derived products. The present sequence represents alpha-amylase/glucoamylase fusion process. The present sequence represents calpha-amylase/glucoamylase fusion procein, which is given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polynucleotide encoding hyperthermophilic processing enzymes e.g. alpha-amylase, useful for producing plant to produce food products having improved taste or fermentable substrates for ethanol.
                                                                                                                                                                                                                                                                Self-processing plant; plant; processing enzyme; alpha-amylase; grain; pullulanase; alpha-glucosidase; glucose isomerase; glucoamylase; mesophilic; thermophilic; hyperthermophilic; transgenic plant; starch; maltodextrin; ethanol; fermentation; beverage; enzyme.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           23-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  28-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0-JUN-1999
 ö
                                                                                                                                                                                                                                    The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, laukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                  Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein identification, signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
